Main Difference - Monohybrid Cross vs Dihybrid Cross. Monohybrid cross and dihybrid cross are two genetic crossing methods that are used to study the inheritance of allele pairs. These are useful in understanding the inheritance of traits from one generation to another. Monohybrid cross is a genetic cross that involves a single pair of genes that is

Monohybrid Ratio for Monohybrid Cross:  
Monohybrid ratio is defined as the phenotypic ratio of different types of offsprings (dominant and recessive) obtained in F<sub>2</sub> generation of a monohybrid cross. In monohybrid cross experiment the phenotype ratio for F<sub>2</sub> generation is 3:1. Mendel's Conclusions for Monohybrid Cross:
